Having your data all in one solution is only the first step, you need to be able to use that data to make better business decisions. That requires flexible reporting options.

Business Challenge

Many organizations find that after spending considerable time and effort to store and track their data they still don't have the ability to use that data to drive better business decisions. Other solutions provide a large catalog of canned reports, most of which you will never use, or complicated reporting tools that require programming skills.

Solution

PCR takes a different approach to reporting. We offer a variety of options to gain visibility into your data that are simple to use. With our solution there are options that will allow even non-technical staff to create reports and produce them in several different formats, quickly and easily. This also reduces the burden on your programmers to create reports for others.

During implementation your PCR project manager will work with you to define and setup the reports you need.

Reporting Options

- **Look-Up Tables**: All search screens in PCR-360 are in the form of grids, similar to Microsoft Excel. Users can define the fields to show on a search screen and the order they appear. Users can also sort and filter this data as needed. Once you have the data needed, with a single click a report can be created. This report can be generated as a PDF, CSV file, or HTML. Users can save the parameters to reproduce the report as needed or schedule it to run at predefined times.

- **AdHoc Grids**: While Look-Up Tables provides data within a single table, AdHoc Grids allows you to combine data from multiple tables. PCR-360 includes several standard AdHoc Grids or your staff with knowledge of SQL language can create new AdHoc Grids.

- **Crystal Reports**: PCR-360 includes Crystal Reports within the application that allows organizations to create more extensive reports if needed. However, most customers have found the grid report capabilities fulfills their needs and Crystal reports are not needed.

- **Dashboards and Widgets**: PCR-360 allows individual users to configure their home page to show a variety of charts and graphs, updated in real time.
